Computations supporting Example ??? in the paper ??? by Igor Zobovič and Aljaž Zalar.

This example shows studies a linear operator L which is represented by a measure μ which contains the atom t = 0 with multiplicity 1. However, since rank(HH K) = rank(HH), it follows that L is also represented by a measure $\tilde{\mu}$ which contains the atom t = 0 atom with multiplicity p = 2. Let $\mu = \sum_{j=1}^4 x_j A_j$ be a finitely atomic matrix measure with $(x_1, x_2, x_3, x_4) = (0, 1, -1, 2)$ and $(A_1, A_2, A_3, A_4) = (\begin{pmatrix} 2 & 2 \\ 2 & 2 \end{pmatrix}, \begin{pmatrix} 1 & 1 \\ 1 & 1 \end{pmatrix}, \begin{pmatrix} 0 & 0 \\ 0 & 1 \end{pmatrix}, \begin{pmatrix} 1 & 0 \\ 0 & 0 \end{pmatrix})$, and let L be a linear operator, defined by L(f) = $\int f \, dl \, \mu$.

```
ln[1]:= x1 = 0
        x2 = 1
        x3 = -1
        x4 = -2
        atoms = \{x1, x2, x3, x4\};
        A1 = \{\{2, 2\}, \{2, 2\}\};
        MatrixForm[A1]
        A2 = \{\{1, 1\}, \{1, 1\}\};
       MatrixForm[A2]
        A3 = \{\{0,0\},\{0,1\}\};
        MatrixForm[A3]
        A4 = \{\{1, 0\}, \{0, 0\}\};
        MatrixForm[A4]
        masses = {A1, A2, A3, A4};
 Out[1]= 0
 Out[2]= 1

```

For every $i \in \{0, 1, 2\}$ we define $Si := L(x^i)$.

```
In[15]:= f0[x_] := 1;
       f1[x_] := x;
       f2[x_] := x^2;
       S0 = Total[masses * (f0 /@ atoms)];
       MatrixForm[S0]
       S1 = Total[masses * (f1 /@ atoms)];
       MatrixForm[S1]
       S2 = Total[masses * (f2 /@ atoms)];
       MatrixForm[S2]
Out[19]//MatrixForm=
        /4 3\
       3 4
Out[21]//MatrixForm=
        / -1 1 \
        1 0
Out[23]//MatrixForm=
        / 5 1 \
        1 2
```

We define the moment matrix M := M(1), the (x - t)-localizing matrix HH, and the matrix K.

```
in[24]:= M = ArrayFlatten[{{S0, S1}, {S1, S2}}];
          MatrixForm[M]
          HH = S1;
          MatrixForm[HH]
          K = S2;
          MatrixForm[K]
Out[25]//MatrixForm=
             3 4 1 0
            -1\ 1\ 5\ 1
           1 0 1 2
Out[27]//MatrixForm=
           \left(\begin{array}{cc} -\mathbf{1} & \mathbf{1} \\ \mathbf{1} & \mathbf{0} \end{array}\right)
Out[29]//MatrixForm=
           / 5 1 \
           1 2
```

We check that M is positive definite by computing its eigenvalues.

```
In[30]:= N[Eigenvalues[M]]
Out[30]=
       {7.10792, 5.59462, 2.27536, 0.0221038}
```

Although the measure contains the atom t = 0, its multiplicity is rank(A1) = 1. However, the localizing matrix HH is invertible, therefore rank(HH K) =

rank(HH), and thus there exists a 4-atomic \mathbb{R} -representing measure $\tilde{\mu}$ for L which contains the atom t = 0 with multiplicity 2. Such measure $\tilde{\mu}$ is unique and we will now find its atoms. We first compute $Z := S_3^{(\tilde{\mu})} = K^T H H^{-1} K$.

```
In[31]:= Z = Transpose[K].Inverse[HH].K;
       MatrixForm[Z]
Out[32]//MatrixForm=
        / 11 13 \
        13 8
```

We now obtain the generating polynomial polH(x).

```
In[33]:= H = Inverse[M].ArrayFlatten[{{S2}, {Z}}];
       MatrixForm[H]
       H0 = H[1; 2];
       MatrixForm[H0]
       H1 = H[3;; 4];
       MatrixForm[H1]
       polh[x_] := x^2 IdentityMatrix[2] - (H0 + x H1)
       polH[x_] // Simplify // MatrixForm
Out[34]//MatrixForm=
        0 0
        0 0
        1 2
        6 3
Out[36]//MatrixForm=
        / 0 0 \
        00
Out[38]//MatrixForm=
        / 1 2 \
        6 3
Out[40]//MatrixForm=
        (-1 + x_) x_ -2 x_
           -6 x_{-}  (-3 + x_{-}) x_{-}
```

We compute the determinant from which we get the atoms.

```
In[41]:= Factor[Det[polH[x]]]
             Solve [Det [polH[x]] == 0, x]
Out[41]=
            x^{2} \left(-9 - 4 x + x^{2}\right)
Out[42]=
             \left\{\,\{x	o0\}\,\text{, }\{x	o0\}\,\text{, }\left\{x	o2-\sqrt{13}\,
ight\}\,\text{, }\left\{x	o2+\sqrt{13}\,
ight\}\,\right\}
```

We will now find the corresponding masses. First we compute the Vandermonde matrix and its inverse.

$$\begin{pmatrix} 1 & \frac{4}{9} & -\frac{1}{9} \\ 0 & -\frac{17+4\sqrt{13}}{18\sqrt{13}} & -\frac{-2-\sqrt{13}}{18\sqrt{13}} \\ 0 & -\frac{-17+4\sqrt{13}}{18\sqrt{13}} & -\frac{2-\sqrt{13}}{18\sqrt{13}} \end{pmatrix}$$

We compute the corresponding masses by InvV {S0, S1, S2}.

in[48]:= newMasses = Table[InvV[r]].{S0, S1, S2}, {r, 1, Length[InvV]}]; newMassesSimplified = FullSimplify[ArrayFlatten[Transpose[{newMasses}]]]; rationalizeExpr[expr] := PowerExpand[Together[Rationalize[expr, 0]]]; newMassesRationalized = Map[rationalizeExpr, newMassesSimplified, {2}]; MatrixForm[newMassesRationalized]

Out[52]//MatrixForm=

$$\begin{pmatrix} 3 & \frac{10}{3} \\ \frac{10}{3} & \frac{34}{9} \\ \frac{1}{26} & (13+3\sqrt{13}) & \frac{1}{78} & (-13-5\sqrt{13}) \\ \frac{1}{78} & (-13-5\sqrt{13}) & \frac{1}{117} & (13+2\sqrt{13}) \\ \frac{1}{26} & (13-3\sqrt{13}) & \frac{1}{78} & (-13+5\sqrt{13}) \\ \frac{1}{78} & (-13+5\sqrt{13}) & \frac{1}{117} & (13-2\sqrt{13}) \end{pmatrix}$$
